***PHOTOVOLTAIC SYSTEMS* Dec 11 2020** This book offers a comprehensive treatment of the fundamentals of solar cells and their use in the photovoltaic (PV) technology, a major constituent of renewable sources of energy. It discusses the nature and measurement of solar radiation, methods for characterization of solar cells and determination of their parameters. The book describes the principle of operation of different types of inverters used in PV systems and also illustrates the design, construction and performance of photovoltaic operated systems such as the solar lantern, solar water pump, solar inverter and a general solar power system. Besides, it explains the process of uploading of power generated by solar arrays to the power grid for onwards transmission to distant locations. The economic aspects of the PV systems and their conventionally operated counterparts are also dealt with. The design procedure given in the book enables the reader to configure the desired PV system without the help of high priced patented software. The text is intended for a course on PV technologies undertaken by the undergraduate and postgraduate students of Electrical Engineering, Energy Studies, and Mechanical Engineering. In addition, the book would also be useful for teachers, scientists, engineers and professionals to

quickly understand the fundamentals of photovoltaic technology. **KEY FEATURES :** About one hundred figures, fifty circuit diagrams and several design examples are given. A large number of problems are given at the end of some chapters. References are provided for further study and research.

**Analysis and Design of Information Systems Aug 19 2021** The text is designed to be used in a semester course in systems analysis and design. It introduces topics in an order most easily grasped by students: early chapters focus on feasibility studies and requirements determination, later chapters are oriented toward design specification and implementation. Systems analysis and design is a challenge for the classroom, because it is outside the context in which applications are generally created. Systems analysis and design depend on tools, situations, and experiences that are difficult to recreate in the classroom. The accompanying tools (case studies, objectives, benchmarks, etc.) have been developed to give students a practical, applications-oriented understanding of system analysis and design.

***Business Analysis and Design Sep 19 2021*** This textbook offers an essential introduction to design orientation in business, which impacts the way management is undertaken world-wide. Design orientation, as it applies to business, is the process through which a designer analyses business as a system, identifies motivation for changing the system, and designs improvement for the organisation, as well as ways of implementing this improvement. It involves strategic and innovative thinking, communication with key stakeholders, and change management. This book provides coverage of critical tools for design which enable business professionals to analyse existing ways of organizing and to design new ways of organizing. The reader will learn how to develop a digital business model to organize private, public or voluntary work. In doing so, the reader will learn to critically evaluate the notion of digital innovation and understand the proper place of ICT within organization. The reader will learn how

to: critically evaluate the relevance of digital innovation to domains of organisation develop digital business models to organize private, public or voluntary work construct business strategy and relate it to business models, motivation models, innovation management and change management Written by an expert in the field, this book is designed for both students and professionals. Each chapter contains an introduction, a section of key reading, and a summary, while a number of cases based on real-life examples are worked through as examples in the text, demonstrating the real-life application of the design theory discussed.

**Space Mission Analysis and Design Sep 27 2019** The goal of this book is to allow you to begin with a "blank sheet of paper" and design a space mission to meet a set of broad, often poorly defined, objectives. You should be able to define the mission in sufficient detail to identify principal drivers and make a preliminary assessment of overall performance, size, cost, and risk. The emphasis of the book is on low-Earth orbit, unmanned spacecraft. However, we hope that the principles are broad enough to be applicable to other missions as well. We intend the book to be a practical guide, rather than a theoretical treatise. As much as possible, we have provided rules of thumb, empirical formulas, and design algorithms based on past experience. We assume that the reader has a general knowledge of physics, math, and basic engineering, but is not necessarily familiar with any aspect of space technology. This book was written by a group of senior engineers with over 800 years of collective space experience. It reflects the insight gained from this practical experience, and suggests how things might be done better in the future. From time to time the views of authors and editors conflict, as must necessarily occur given the broad diversity of experience. We believe it is important to reflect this diversity rather than suppress the opinions of individual authors.
